ECOCARDIOGRAFIA NELLA SINDROME CORONARICA CRONICA - ECOSTRESS

Ercole Tagliamonte, FESC, FACC, FEACVI

CASO CLINICO

- RG, maschio, 61 anni
- Fattori di rischio: Dislipidemia, tabagismo, familiarità per CAD
- Asintomatico
- Ricovero per sospetta coronaropatia
- Esami ematochimici:
 - Colesterolo LDL 112 mg/dl
- Esame ecocardiografico basale nella norma
- Esame coronarografico.....

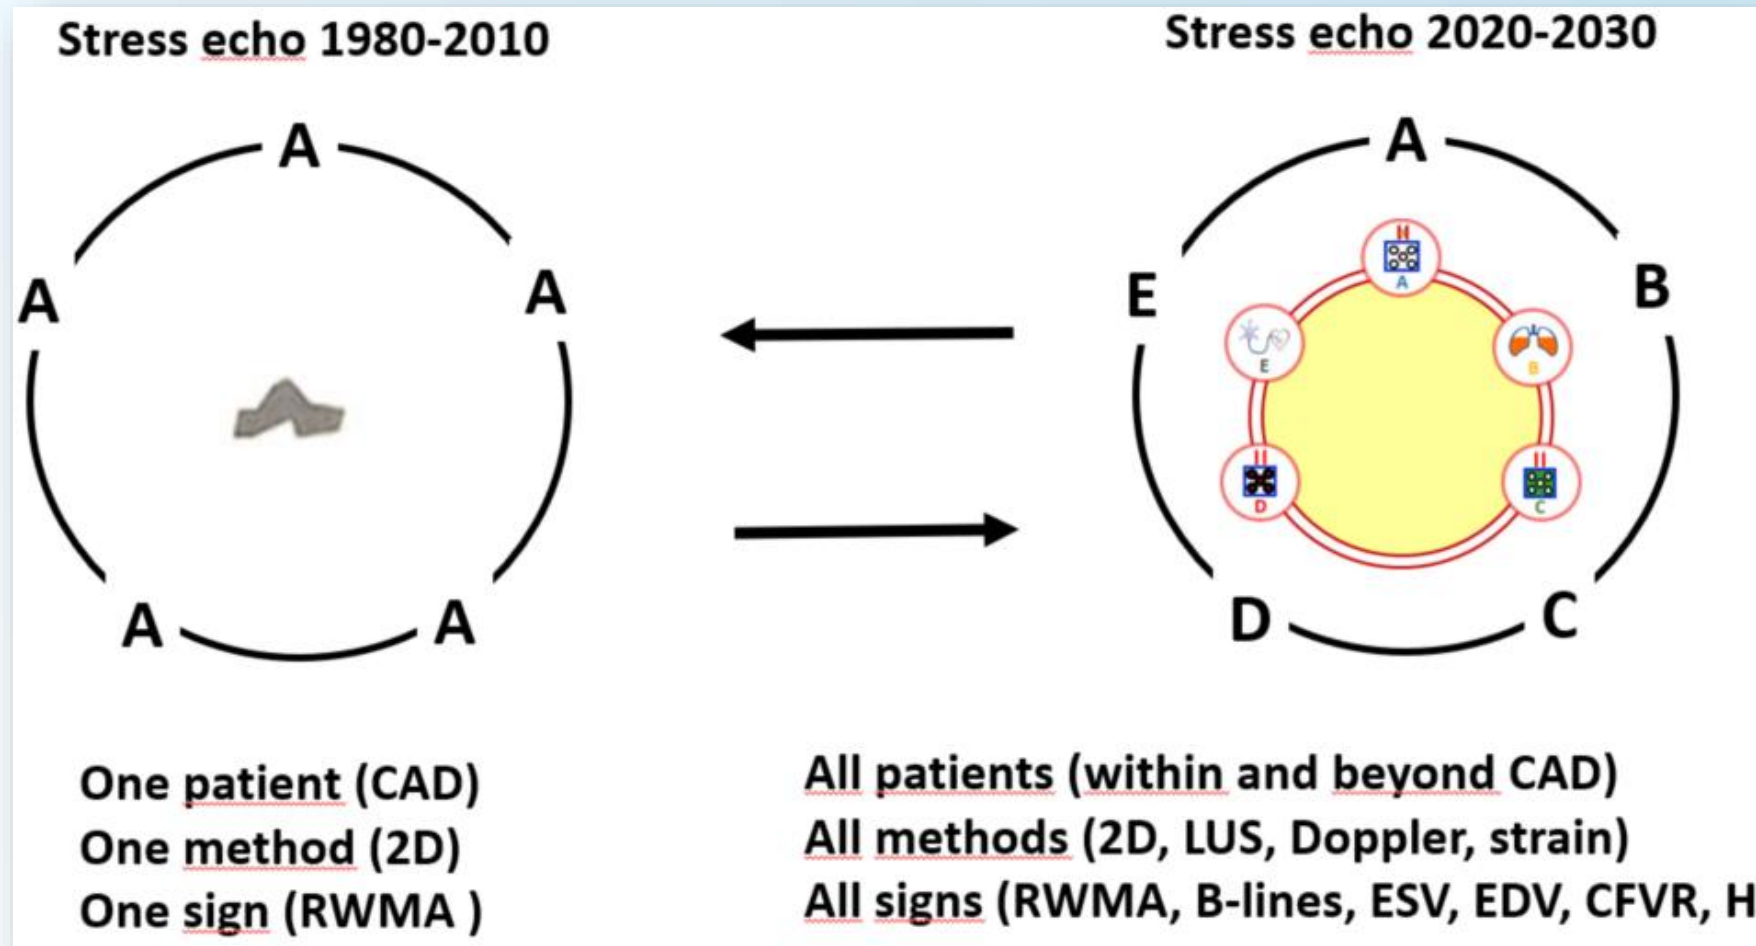

Questo è un lavoro per...

tress-Echo

The evolution of Stress Echo

Stress echocardiography assessed by the ABCDE protocol

3,574 patients
 with known or
 suspected
 chronic coronary
 syndromes

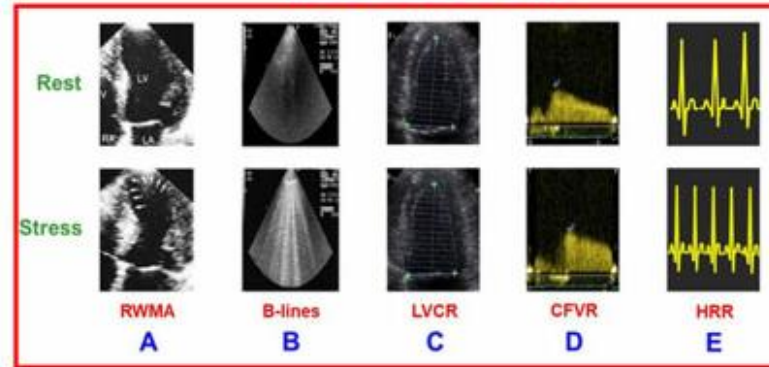

13 centers from 5 countries
 enrolling after web-based quality control of each of
 the 5 steps (A B C D and E) of stress echo reading

Median follow-up time
 21 months

Outcome measure
 73 all-cause deaths

ABCDE Stress Echo

All 5 parameters were
 normal (score 0) in 31%;
 score 1 to 4 in 44%;
 all abnormal (score 5) in 5%
 of patients

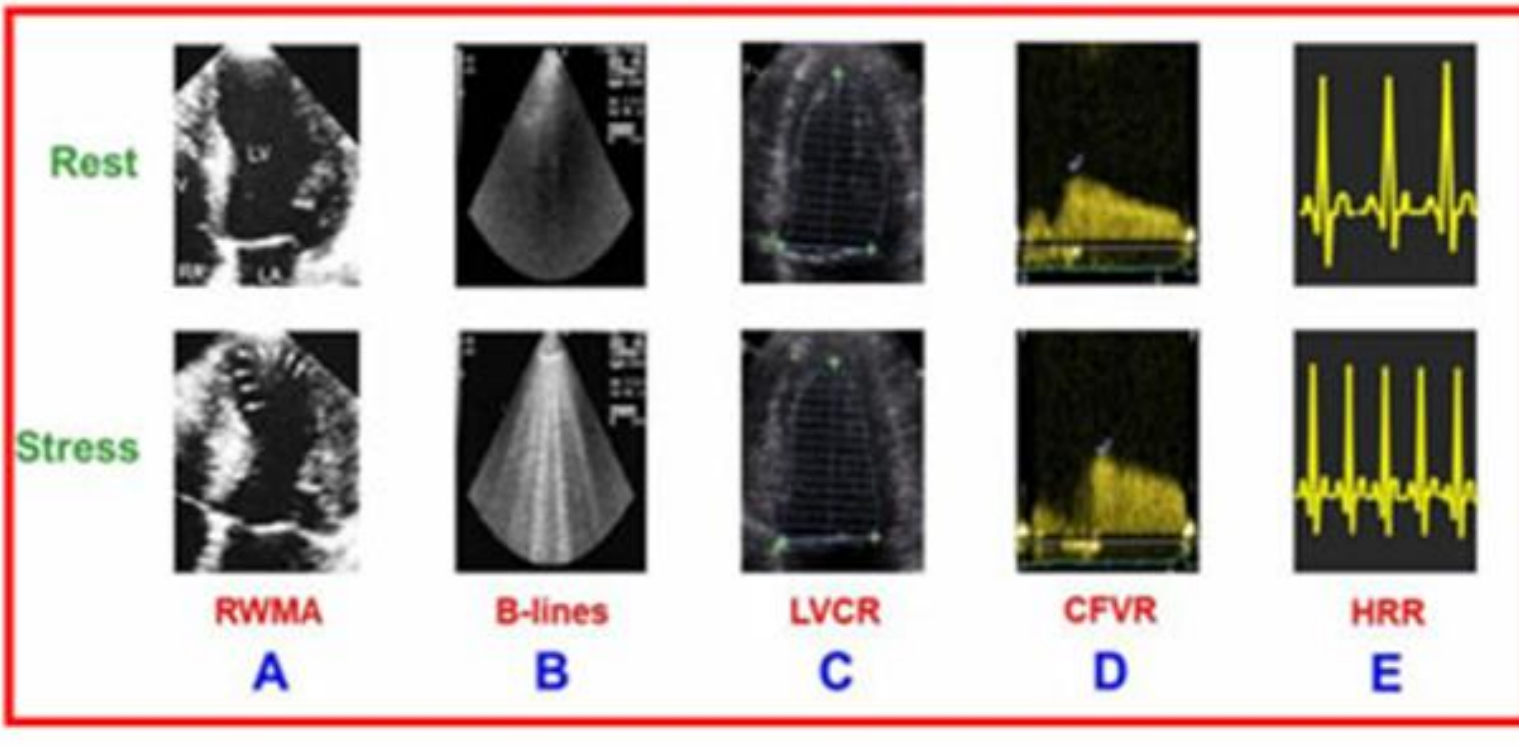

Low Risk
 Nonischemic-dry-strong-warm-fast heart (ABCDE score = 0)

High Risk
 Ischemic-wet-weak-cold-slow heart (ABCDE score = 5)

ABCDE Stress Echo

ABCDE SE General Protocol

Stress Echo (baseline)

Stress Echo (Step A – RWMA)

LEFT VENTRICULAR CONTRACTILE RESERVE

- Left ventricular contractility reflects the force of myocardial muscle
- The relationship between end-systolic pressure and volume is regarded as a correct index of contractility
- Left ventricular contractile reserve (LVCR) is a global left ventricular response to exercise, and can be assessed by stress echocardiography
- The stress/rest ratio of a non-invasive pressure-volume relationship, between systolic blood pressure and left ventricular end-systolic volume, is independent from preload and afterload changes, and has demonstrated to be prognostically powerful

Stress Echo (Step C – Left Ventricular Contractile Reserve)

- Step C of protocol included the force-based assessment of LVCR
- Force = Systolic blood pressure/end-systolic volume
- LVCR = Stress/rest ratio of force
- **Normal range**
 - > 2.0 (Dobutamine)
 - > 1.1 (Dipyridamole/Adenosine)

Stress Echo (Step D – Coronary Flow Velocity Reserve)

Stress Echo (Step D – Coronary Flow Velocity Reserve)

- LVCR = stress/rest ratio of peak diastolic velocity
- **Normal range: > 2**

Stress Echo (Step E – Heart Rate Reverse)

- HRR = stress/rest ratio of Heart Rate
- Normal range
 - > 1.8 (Dobutamine)
 - > 1.22 (Dipyridamole/Adenosine)

Step A

Rest

Stress

Step B

Step C

Step D

Step E

RWMSI = 1

RWMSI = 1

Rest B-lines = 0

Stress B-lines = 0

Rest Force = 3,48 mmHg/ml

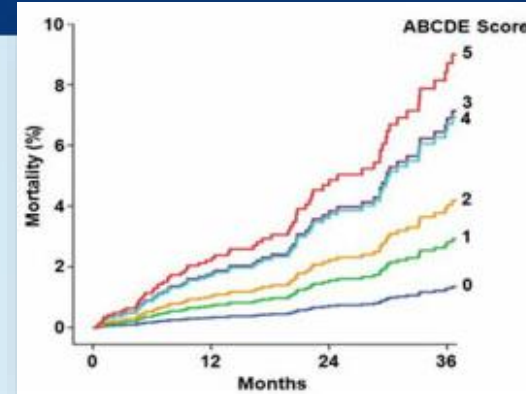

Peak Force = 5,12 mmHg/ml

Rest Coronary Flow = 27 cm/sec

Peak Coronary Flow = 76 cm/sec

Rest HR = 50 bpm

Peak HR = 88 bpm

Δ WMSI = 0

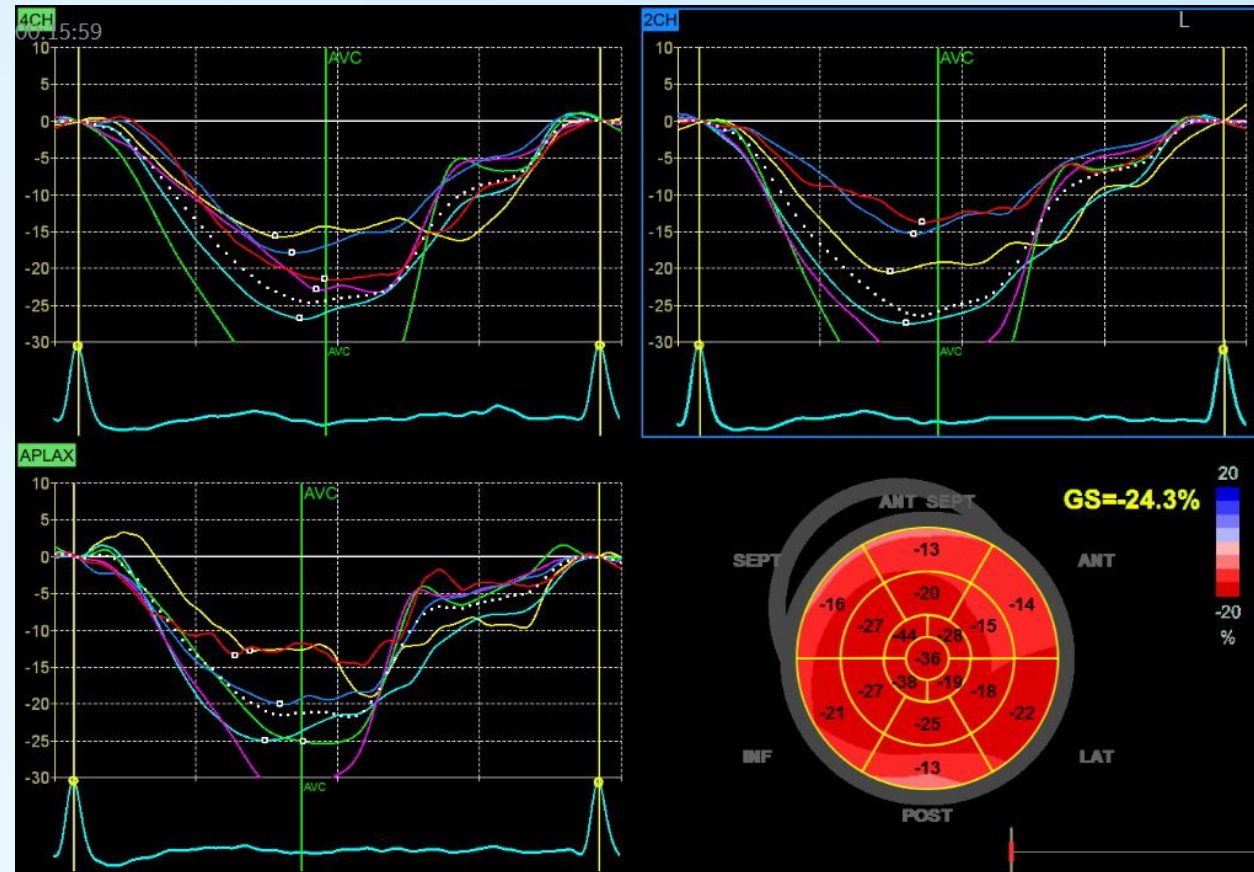

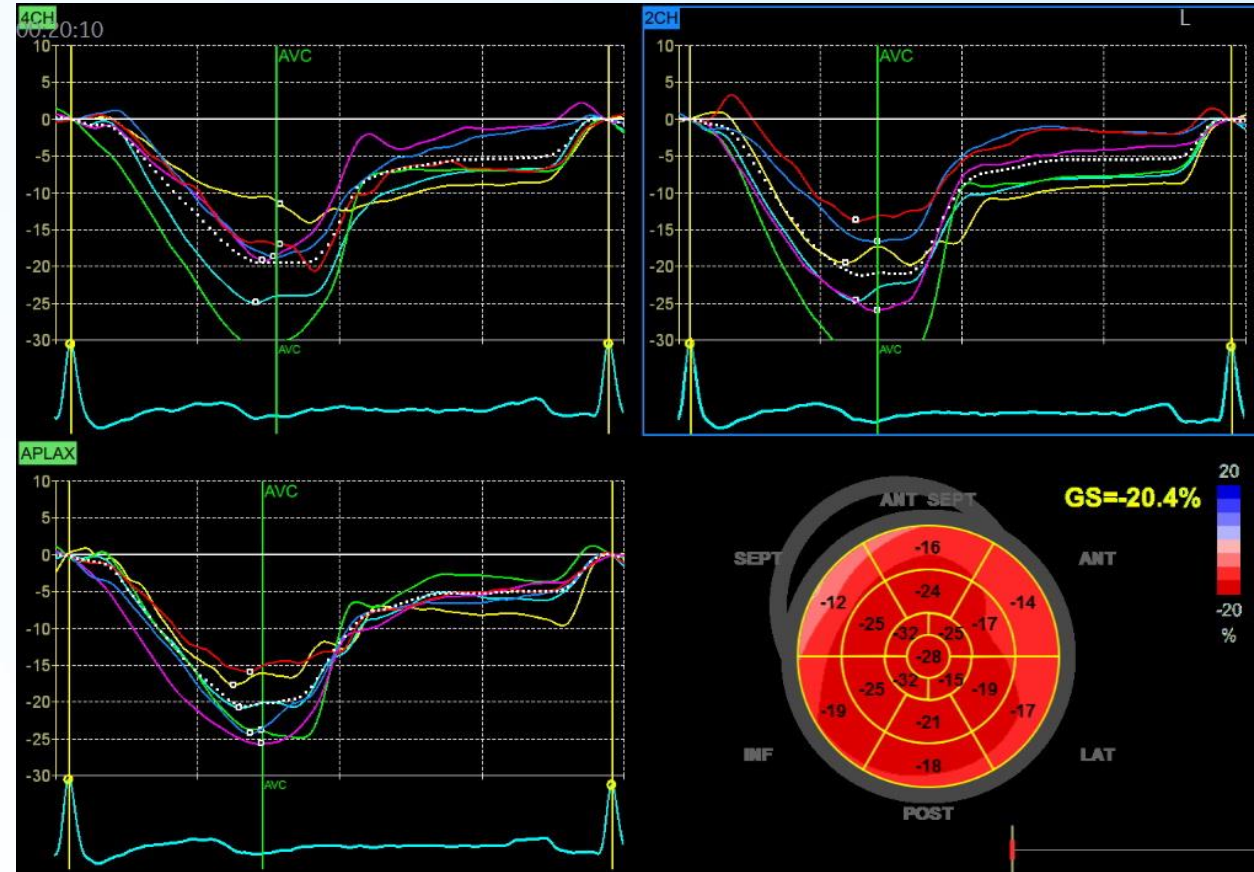

Δ B-lines = 0

LVCR = 1.47

CFVR = 2.8

HRR = 1.76

Stress Echo (Global Longitudinal Strain)
